c++ template class bubble sort operand error

Hi i trying to create a template method to sort a vector of object by their x coordinate. They are giving me operand error with the '=' sign

Inside main have some codes, vector point2d have already data being populated.

```
vector<Point2D> point2d;
.....
point2d = sortByAscX(point2d, point2d.size());
```

my template.h

```
template <class T>
vector<T> sortByAscX(vector<T> a1, int size) {
    for(int x=0; x<size; x++) {
        for(int y=0; y<size-1; y++) {
            if(a1[y].getX()<a1[y+1].getX()) {
                int temp = a1[y+1].getX();
                a1[y+1].setX(a1[y].getX());
                a1[y].setX(temp);
            }
        }
    }
    return a1;
}
```

Error

```
MyTemplates.h:32:20: error: lvalue required as left operand of assignment
a1[y+1].getX() = a1[y].getX();
                ^
MyTemplates.h:34:18: error: lvalue required as left operand of assignment
a1[y].getX() = temp;
```

getX() returns a value. you're assigning a literal to yet another literal. – [Achilles Rasquinha](#) May 22 '15 at 18:21

I tried changing to set value but it come out 0 – [Tommy Yap](#) May 22 '15 at 18:28

The reason you are getting this error is that you are calling a `getX()` function and trying to set it equal to a value. You need to have or call a `setX()` function and pass your value through it. You can only get a value with a get function.

[answered May 22 '15 at 18:19](#)

i tried doing this and it produce 0 int temp = a1[y+1].getX(); a1[y+1].setX(a1[y].getX()); a1[y].setX(temp); – [Tommy Yap](#) May 22 '15 at 18:24

What do you mean it produced 0. In the code you have it looks like you are trying to swap the X values of 2 elements of a vector. Please be more specific. – [NendoTaka](#) May 22 '15 at 18:45

As [@NendoTaka](#) correctly explained, you are trying to assign to a rvalue. If you want to use the same function for both a getter/setter, then make it return a reference

```
T& getX() { ... }
```

although now the name will be a tad confusing, as most people expect the getter to return an non-mutable object.

I tried changing to set value but it come out 0 – [Tommy Yap](#) May 22 '15 at 18:34

What does `getX()` return? It must not be an assignable value because that is what the compiler is complaining about. If it returns a reference of the X value, you can assign to it, but if it is `const` or returns a copy you can't assign to it.

Can you post your relevant Point2D code? – [pelotron](#) May 22 '15 at 22:07
